Language Science Press

Empirically Oriented Theoretical Morphology and Syntax

This series aims to publish high quality books that contribute to a better understanding of phenomena in morphology, syntax and the interplay between both. Since the recent history in linguistics showed that basic assumptions may change rather quickly, the ideal submission to this series is one that separates data discussion resulting in pre-theoretic generalizations and analysis. Such a separation ensures that published books will have some value even if the linguistic framework is radically changed or becomes irrelevant one day. The separation of the description of the phenomenon from the analysis ensures that readers that are non-experts in more formal f rameworks will find the books useful.

Such a separation ensures that published books will have some value even if the linguistic framework is radically changed or becomes irrelevant one day. The separation of the description of the phenomenon from the analysis ensures that readers that are non-experts in more formal f rameworks will find the books useful.

Requirements

The data discussion should be theoretically informed: Positive and negative examples appearing in the literature on the phenomena discussed should be included in the discussion, regardless of the specific framework used in the publication. Controversial examples ideally are backed up by experimental or corpus data. Thorough formalization of the kind that is known from work in HPSG, LFG, or TAG is not required but is welcome. Work that is backed up by a computer-processable implementation is also eligible to be published in the subseries Implemented Grammars.

Language Science Press

Studies in Diversity Linguistics

This book series publishes book-length studies on individual less-widely studied languages (especially, but not only, reference grammars), as well as works in broadly comparative typological linguistics that takes into account the world-wide diversity of human languages. Work on individual languages and broadly comparative work is of a different nature, but this series sees the two as closely related: Comparative studies need in-depth work on individual languages from around the world to build on, and descriptive work is done best in a comparative perspective.

Language Science Press

Textbooks in Language Sciences

This series aims to publish high-quality textbooks in any area of the language sciences. Since students can least afford expensive books, freely available textbooks are particularly important for the advancement of knowledge. And since there is no reason why textbooks need to be published under the label of an old traditional publisher, we expect that a large number of textbooks will soon be available in open access. Language Science Press is the first publisher of free textbooks. Unlike commercially published textbooks, the books in this series do not have a particular length requirement, so shorter textbooks are also welcome, as are textbooks on more specialized topics that might not be commercially viable.

language science press

Language Science Press

Topics at the Grammar-Discourse Interface

We publish high-quality monographs and edited collections focusing on the interface between discourse structure, information structure and text structure, in particular discourse structure, rhetorical relations, information structure , anaphora resolution, textual cohesion, ellipsis, salience, etc. We have a focus on using naturally-occuring data (whether from linguistic corpora or from literary texts) wherever possible. The kind of topics we would like so see addressed include (but are not limited to): formalisms for modelling discourse felicity, information structure, anaphora resolution, ellipsis, scope phenomena, sentence connection, perspective in literary text, computational approaches to discourse phenomena.
